

Your next chapter in data

A practical guide to the site, its learning experience and what comes next.

A clearer path from “where do I start?” to “here is what I can do.”

DataPath is a career-focused learning workspace. It helps learners choose relevant skills, study topics in sequence, practise with industry examples, review mistakes and collect evidence of their work.

Who it is for

Complete beginners exploring data, students preparing for a first role, and professionals building skills for a new career or industry. A beginner can start with a simple table before writing code.

The goal

Make the next learning step clear and connect knowledge to practical work. Success means being able to explain a result, reproduce it and recognise its limitations - not simply checking off lessons.

18

career paths

28

skill areas

9

industry contexts

The catalogue contains 252 topics. Depth varies: the site is still expanding its fully authored lessons and guided exercises. These counts describe scope, not a guarantee of complete mastery coverage.

What this guide covers

Getting started (page 2), an actual roadmap screenshot (page 3), the learning loop (page 4), Practice Lab (page 5), supporting features and saving (page 6), and upcoming development (page 7).

Edition note: feature descriptions reflect the current project. The screenshot is a user-supplied earlier view; live capture was blocked by the browser security-policy check.

One goal. A useful next step.

Choose a path and industry, then begin with a manageable learning session.

01 Set your direction

Choose a career goal, industry, experience level and available study time. Relevant tools and existing skills help shape the roadmap. The beginner shortcut offers a provisional Data Analyst path so choosing everything upfront is not a barrier.

02 Learn in a familiar context

The nine contexts are banking, finance, marketing, healthcare, retail, technology, telecom, government and general. Practice uses synthetic records, terminology and units suited to the selected industry.

03 Start small

New learners begin with a no-code exercise: read a table, select completed records, calculate a total and explain the rule. The first foundations unit then adds averages, zero and missing values.

04 Follow the roadmap

Choose a skill, open a topic and work through the lesson, example and checks. Time and week labels help with planning; they are estimates, not promises about how long learning will take.

05 Return with a purpose

Use the next-lesson dashboard and review queue to decide what to do next. Practice recommendations consider unfinished work and recent difficulties, and explain why an exercise was selected.

Example learner: A beginner interested in telecom starts with record-level reasoning, studies filtering and summaries, practises with telecom data, and eventually builds a churn or service-quality analysis. The aim is to connect the technique to a business question.

First-session checklist: choose a path, complete one small exercise, read the feedback, explain your answer and make sure your progress is saved.

Inside My roadmap

An earlier dark-mode view supplied by the project owner.

My workspace / My roadmap Guest mode

Domain project: Build a churn or service-quality analysis linking customer behavior with network signals.

01 **Learn** → 02 **Practice** → 03 **Assess** → 04 **Review**
Concept + example Edge case + evidence Technical quiz Weak topics return

SQL 6

Data modeling 6

Power BI 9

Excel 6

Data quality 3

Data storytelling 6

SQL Target 2/3

● **Beginner**

1 SELECT and WHERE 3 hrs · Week 1

2 GROUP BY and HAVING 3 hrs · Week 2

3 INNER and LEFT JOIN 3 hrs · Week 3

🏆 **LEVEL QUIZ**

SQL - Beginner Assessment
10 questions · Pass 80%

Complete the required topic lessons and mini-quizzes to unlock this assessment.

● **Intermediate**

4 Subqueries and CTEs 5 hrs · Week 5

1. Navigation: learning, practice, progress and career support share one workspace. **2. Skill selection:** choose the subject you want to study. **3. Topic panel:** expand a lesson and see its estimated effort. **4. Assessment:** required lessons and mini-quizzes unlock the level check.

Learn, practise, assess, review

A repeatable loop that turns mistakes into the next learning task.

Learn: explanations before tools

Roadmap topics provide learning guidance and resources. Authored lessons add worked examples and common mistakes. A searchable glossary explains data vocabulary when unfamiliar terms interrupt progress.

New: foundations unit 1

“From raw records to a reliable answer” teaches eligible-record counts, totals and averages. It explicitly separates a valid zero from a missing value and explains why each changes the denominator differently.

Worked example: see which records qualify and follow the calculation.

Supported attempt: enter results, choose an explanation and request hints.

Independent check: solve a changed dataset so copying the earlier totals does not pass.

Completion: save the result for the selected industry, then continue to relevant SQL or Excel lessons.

Assess: check understanding

Topic and level quizzes check learning and identify mistakes. Required work must be completed before locked assessments become available. Completing the foundations unit does not automatically pass other skill assessments.

Review: revisit weak topics

Incorrect responses and failed practice checks can bring topics back into review. Spaced review schedules return visits, while weak-topic signals can prioritise earlier attention. Topic links lead back to the relevant lesson.

Where to find the new unit: My roadmap → Start with the foundations. New learners also see it after the first beginner lesson on the dashboard or Practice Lab.

Current scope: one English-language foundations unit. Broader guided coverage is planned; the whole curriculum is not yet delivered in this format.

Practice the work your path needs

Exercises vary by career requirements, topic and industry.

SQL: execute and inspect

Twelve challenges cover filtering, aggregation, joins, dates, subqueries and other core techniques, including debugging tasks. Checks use the visible data and alternate datasets. Hints, result feedback and attempt history support revision. The current engine is AlaSQL, not a PostgreSQL server.

Python: real execution, focused scope

Three exercises cover filtered totals, missing-value detection and debugging an average. Python runs in a bounded browser worker. Pandas and multi-cell notebooks are planned; arbitrary packages are not part of the current lab.

Excel, DAX and metrics

Focused SUMIF and CALCULATE/SUM exercises, plus metric calculations, support relevant paths. These are limited formula checks, not full Excel or Power BI applications.

Applied cases and industry missions

Case briefs pair downloadable synthetic CSV data with an explanation and self-review rubric. A reconciliation mission introduces duplicates, corrections, missing values and reporting-window rules. Numerical checkpoints check the calculations; the written interpretation is self-reviewed.

A helpful session flow

Open the recommended exercise or browse your path → read the question and data → attempt the task → inspect feedback → revise → save the result or submission. Use the explanation of the recommendation to understand why that exercise matters now.

Evidence matters: executable checks and learner-entered case evidence are shown separately. A self-review is useful practice, but it is not an independent expert assessment.

Everything around the lesson

Use these areas to support learning and prepare evidence of your work.

My progress

Review learning progress and the Proof Ledger. Selected evidence can be exported with a preview, so learners can choose what goes into a report.

Resource library and Tools setup

Find topic-related learning resources and setup guidance for the tools your path requires. External learning material remains separate from in-app exercises.

My projects

Use project briefs, artifact links, revision history and self-review checklists to organise practical work. Independent reviewer assignment is a future upgrade.

Interview studio and Career toolkit

Practise technical explanations, use interview structure prompts and a journal, then connect weak areas to lessons. CV and application tools help organise career preparation.

AI coach

An assistance area supports learning questions. Availability depends on the configured service; its responses should be checked against the lesson, data and actual results.

Settings and saved progress

Guest progress saves in the current browser. Clearing browser data or switching browsers can lose it, so export a backup. Account learners use Save progress. Live database persistence still needs acceptance testing in a configured environment.

Light/dark themes and responsive layouts are implemented. Rendered mobile, keyboard and accessibility acceptance still require verification; code-level checks alone do not establish a complete accessibility audit.

What comes next

Proposed priorities - not a release-date commitment.

1 Complete the foundations sequence

Build the next units around data types, table grain, duplicates, missing-data cleaning, SQL and spreadsheet foundations. Keep the worked-example → guided-attempt → independent-check structure.

2 Extend guided practice

Apply progressive support and meaningful feedback to more exercises. Gradually remove support so learners can demonstrate independent understanding.

3 Deliver a substantial industry project

Connect several skills in one end-to-end brief: prepare data, analyse it, communicate findings and submit reproducible evidence. Add clearer evaluation and, later, independent review.

4 Expand Python analysis

Add pandas, richer datasets and notebook-style work so learners can move beyond short scripts toward practical analysis.

5 Prepare a dependable pilot

Verify accounts, save/restore, navigation, mobile layouts, keyboard use and the complete beginner journey. Expand reviewed content and gather feedback from a small learner cohort.

Current validation: the latest implementation passed type checking, 186 automated tests and a production build. This does not replace live browser or database acceptance.

Guide sources: current project files: Home.tsx, FoundationsUnit.tsx, shared/foundations-unit.ts, PRODUCT_GAPS_AND_BUILD_PLAN.md, PRACTICE_STUDIO_NOTES.md and VALIDATION.md. Screenshot: project owner, 20 September 2026. Feature status checked against local source on 21 September 2026.

Screenshot coverage: only the supplied roadmap image was available. Fresh onboarding, dashboard, lab and progress screenshots remain to be added when browser capture is available.
